Fully Connected
BUNDLE

What's the difference between 2.4 GHz and 5GHz?

These numbers refer to the frequency bands your Wi-Fi uses, and each has its own strengths.

Quick Breakdown

2.4 GHz: Slower speeds, but better range. Great for larger spaces or when you're farther from the router.

5 GHz: Faster speeds, but shorter range. Perfect for streaming, gaming, or when you're close to your router.

Think of 2.4 GHz as a long-distance runner and 5 GHz as a fast sprinter.

When to Use Each

Use 2.4 GHz if you're farther from your router or using smart home devices.

Use 5 GHz if you're close by and want faster speeds for video calls, Netflix, or gaming.

Our Managed Wi-Fi takes care of this for most devices.

If you're still noticing slow spots or dead zones, talk to us about your Managed Wi-Fi equipment or our new Outdoor Extender options—**perfect for backyard streaming or working from the porch.**
